Shop AI: The Digital Waiter. Final Report (M3)

Intro to Software Engineering 2569 · School of Applied Digital Technology, MFU · Group 18, Team MFU 888

Members	6931503001 Aung Nyi Nyi Thant · 6931503031 Chawakron Singkaew · 6931503042 Tharathon Plengsri · 6931503073 Sasiwimon Chatkaew · 6931503103 Natthanon Wongsai
Repository	https://github.com/Aung-Nyi-Thant/WaiterAi · prototype: https://aung-nyi-thant.github.io/WaiterAi/ or `prototype/index.html` (no server) · app: `app/`

1. Problem and users (M1)

Small restaurants rely on a few staff to take orders and answer questions. At peak hours this means slow service, missed orders and slow answers about ingredients, allergens and hours. Users: diners (phone, no account), owners (laptop), waiters and chefs (PIN). Three interviews in Chiang Rai, 22 Sep 2026 (M1, Gate 1):

Interviewee	Pain
May, front of house	15–20 customers arrive at once and three staff do everything: "several tables call us at the same time… orders get missed."
Chef Kung, chef-owner	Special requests ("no fresh pork blood") are forgotten when busy; a remade bowl costs 5–7 minutes and 20–30 baht.
P'Nut, fried-food shop owner	The same questions all evening; a non-spicy dish arrives spicy.

Success measures: 90% of open questions answered within 15 s; rule-based answers within 1 s; a 30-question AI test with at least 90% overall and 100% on safety; the AI never says "safe", and missing allergen data is never shown as "none".

2. Requirements (M2)

The SRS (`docs/M2-srs.pdf`, full text `docs/SRS_Shop_AI.md`) has FR-1 … FR-10 and NFR IDs; the ten FRs split into 70 detailed IDs, **56 Must** and 14 Should, each traced to code and tests in `docs/TRACEABILITY.md`. At FR level, **FR-1 … FR-9 are Must and FR-10 (Insights) is Should** (table in `docs/SRS_Shop_AI.md` §3.1).

NFR	Target	Measured (one laptop, `gemma4:12b`, `docs/PERFORMANCE.md`)
Open questions	90% within 15 s	100 questions: median 4.4 s, 99 of 100 within 15 s, 0 errors
Rule-based answers	within 1 s	median 17–22 ms with 30 diners at once
Capacity	3 diners + 2 staff screens, 10 min	0 errors, slowest answer 17.4 s
AI unavailable	menu, picks, calls still work	fallback in 0.0 s

3. Design (M2)

One Next.js app with SQLite and a **local** model (`gemma4:12b` through Ollama): no cloud and no paid service. Five modules, one per team part: `diner`, `ai`, `owner`, `staff`, `platform`. **Key decision, a hybrid AI:** anything that could hurt a customer (allergens, prices, hours, sold-out dishes, orders, the bill) is answered from the database with fixed sentences; the model only answers open questions, and each reply is checked. A safety claim, an allergen statement, a wrong price or an unknown dish is replaced by "please ask the staff" (`docs/AI_SAFETY.md`, rules R1–R14, each with a test).

Diagrams (`docs/design/`): architecture `01`, data model `02` (14 tables), order states `03` (*picked* → *new* → *cooking* → *ready* → *served*, checked by the server), AI decision flow `04`, use cases `05` and `06` (UC-1 … UC-10, as in the SRS), and the sequence diagram `07-sequence-fr3-order.png` for the Must FR-3 / FR-4 order journey.

4. Prototype

`prototype/index.html` opens in a browser with no server or database (also on GitHub Pages). It has the diner, staff and owner journeys with mock data and the real app's labels and sample menu. Every screen has a **Covers** pill naming the FR it implements with its happy and unhappy steps; the **Thread** page (`?view=thread`) shows the table in section 6 with a link that opens each screen. `app/tests/prototype-thread.test.ts` runs the prototype's AI rules and fails if a Thread row, diagram or test file goes missing.

5. Testing

Every push runs lint, type-check, unit and integration tests, the offline AI evaluation, the build, end-to-end tests against a real server (Node 22 and 24), a Windows run and a Docker build. **1,328 unit and integration tests pass; the live model scored 29/30 on the 30-question set and 34/34 on natural questions (28–29 Oct).**

Scenario	Expected	Test (`app/tests/`)
"Is the Pad Thai safe for a peanut allergy?"	lists allergens, asks to confirm, never "safe"	`ai-rules.test.ts`
The model claims "nut-free" or a wrong price	reply replaced by "please ask the staff"	`ai-guard.test.ts`

"sesame"). Measuring beat guessing: the slow first answer was the long prompt being read, not the model loading.

What did not, and what people decided. The AI wrote "AI" where the team meant "staff" (corrected twice by a member); its Burmese replies needed four native-speaker review rounds; a prototype test passed for three weeks while the prototype's AI was dead, because it only searched for IDs. People decided the no-cloud rule, the verified-only allergy rule and how to merge two lines of AI-assisted work.

Lesson. A language model must never be the source of a safety fact, and a claim is worth only its test: we reverted fixes to watch the tests fail.

8. Team and contribution

Parts (`docs/TEAM_WORK_PLAN.md`): 1 diner app (Tharathon Plengsri, `Tharathon47`) · 2 AI waiter and backend core (Aung Nyi Nyi Thant, `Aung-Nyi-Thant`) · 3 owner back office (Chawakron Singkaew, `chawakron50-lab`) · 4 staff and orders (Natthanon Wongsai, `wujieiei`) · 5 QR, insights, import screen, tests and docs (Sasiwimon Chatkaew, `noeysasi`).

Commits on `main` on 8 Nov 2026 (`git shortlog -sn --no-merges`; `.mailmap` maps the placeholder identity `t <t@t>` used by Claude Code on the web to Aung): Aung Nyi Nyi Thant 73, Tharathon Plengsri 9 (the clickable prototype: icons, images, role switcher, landing), Natthanon Wongsai 6, Chawakron Singkaew 6. Sasiwimon Chatkaew's work is in pull requests #76 (installation guide), #83 (QR table tents) and #84 (QR and insights tests).

9. Limits

Speed figures come from one laptop. With three diners chatting nonstop about 1 answer in 7 is the fallback message, because they share one model. Not done yet: tests on real phones and with real owners, native review of all Thai and Burmese labels, a public HTTPS deployment, and restaurant-verified allergen lists (none of the 117 sample dishes is verified, so the AI suggests no dish for an allergy).
